Continuation of 11. does NOT place the application in condition for allowance because: Regarding the arguments levied against the final rejection, namely that the IC and transducer elements are not aligned on the same surface, Examiner respectfully disagrees with what effectively defines the integrated circuit, as the circuit of Eberle is an integrated flex circuit, and just because the IC chips are placed away from the transducer does not mean they are not disposed on the same surface of a flex-circuit. Regarding the argument that the acoustic assembly is not placed along a second axis which "Extends substantially perpendicular to the first axis", the axis of the flex circuit of Figure 2 first extends substantially perpendicular to that of the first axis before completing the 180 degree bend about the body, the acoustic assembly thereby being spaced from the components along a second axis that extends perpendicular before completing the 180 degree bend so that the acoustic assembly and the electronic components are both positioned on the same axis.
